

CorridorProof

Shared evidence for uncertain payment outcomes

Sender and receiver teams agree a safe resolution
from an attributable case record.

Live Drunix dashboard / Synthetic payment rails

Manual exceptions remain a documented requirement

Nexus documentation describes manual handling of investigations, recalls and disputes in its first release.

Our narrow question

Can two operations teams share the evidence and approvals needed to resolve uncertain payouts safely?

Documentation supports the problem. Partner demand and savings remain unvalidated.

Unknown payout outcomes need reconciliation

Missing response

A timeout records an exception.
It cannot approve a refund.

Status stays unknown

Receiver evidence determines
the next resolution step.

Late credit

Both parties acknowledge closure. No refund occurs.

Live exception workspace

The screenshot displays the CorridorProof 'Live exception workspace' interface. On the left is a dark sidebar with the CorridorProof logo, navigation links for 'PAYMENT OPERATIONS' (Singapore → India), 'Exception desk', 'Evidence journal', and 'Live Drunix test network'. The main area features a search bar with 'CP-PITCH-20260930' and a 'Queue' dropdown set to 'All cases'. Below this is a button to 'Record an agreed synthetic quote'. The 'Case queue' section shows one case: 'CP-PITCH-20260930 - Missing payout response' with a status of 'RECONCILING'. The 'What this proves' section states: 'Deterministic safeguards and attributable records. Operational savings require a partner pilot.' The 'RECONCILING' section includes a table comparing source principal, recipient commitment, and observed recipient credit.

Source principal	Recipient commitment	Observed recipient credit
SGD 125.00 Fee SGD 1.50 - synthetic	₹7,500.00 Immutable recorded quote	₹0.00 UNKNOWN - simulated rail

The 'Resolution rule' states: 'Reconcile the receiver's authoritative outcome before approving a refund. Unknown does not mean failed.' Available actions include 'Test blocked refund'. Status bars show 'Resolution approvals: 0/2' and 'Closure acknowledgments: 0/2'. The 'Recent case evidence' section lists three events: 'COMMAND REJECTED', 'OBSERVE TIMEOUT', and 'QUOTE ACCEPTED'.

Visible safeguards

Refund denied while outcome is unknown

Two organizations approve corrections

VALID commit receipts for accepted and denied decisions

Evidence and recovery controls

Live ledger comparison

Detect altered or missing exported records by comparing with the current certificate-authenticated workspace.

Safe request recovery

Save the exact request before submission. An uncertain commit blocks replacement actions until reconciliation.

Verified: real concurrent-update conflict, rejected untrusted MSP and restart persistence.

Live dashboard architecture

APPLICATION REQUEST PATH

POLICY AND LEDGER

Local test network includes documented SQL bookmark fixes. Payments are simulated.

Structured status intake

Bind the report to its commitment

Validate case, quote, currency, amount and message identity.
Credited, rejected and blocked reports enter existing policy.

Hold uncertainty and contradictions

Pending and unposted reports cannot prove beneficiary credit.
Save the original request; replay exactly and reject changed contents.

Synthetic JSON adapter. No bank connection or ISO 20022 certification claimed.

Existing products and the governance hypothesis

Swift / Nexus service desk

Established investigation workflows. We must validate what a specific corridor partner still needs.

CorridorProof hypothesis

Independent operators jointly govern accepted evidence and resolution changes without unilateral edit authority.

A trusted shared database remains a valid option when independent governance is unnecessary.

A corridor pilot is the next commercial gate

Candidate buyer
